Task 1 – Hospital Management Database

Prompt

- Create schema and queries for a Hospital Management System with tables
- Doctors, Patients, and Appointments including constraints and analytical queries.

Code

```
ai 16.3 > hospital.sql > ...
  ▶Run on active connection | ≡Select block
1  -- Create schema and queries for a Hospital Management System with tables
2  -- Doctors, Patients, and Appointments including constraints and analytical queries.
3  -- Create the database
4  CREATE DATABASE IF NOT EXISTS ai_lab16;
5  USE ai_lab16;
6  -- Create Doctors table
7  CREATE TABLE Doctors (
8      doctor_id INT AUTO_INCREMENT PRIMARY KEY,
9      name VARCHAR(100) NOT NULL,
10     specialty VARCHAR(50) NOT NULL,
11     phone VARCHAR(15) NOT NULL
12 );
13 -- Create Patients table
14 CREATE TABLE Patients (
15     patient_id INT AUTO_INCREMENT PRIMARY KEY,
16     name VARCHAR(100) NOT NULL,
17     age INT NOT NULL
18 );
19 -- Create Appointments table
20 CREATE TABLE Appointments (
21     appointment_id INT AUTO_INCREMENT PRIMARY KEY,
22     doctor_id INT,
23     patient_id INT,
24     appointment_date DATE NOT NULL,
25     FOREIGN KEY (doctor_id) REFERENCES Doctors(doctor_id),
26     FOREIGN KEY (patient_id) REFERENCES Patients(patient_id)
27 );
28 -- Insert sample data into Doctors
29 INSERT INTO Doctors (name, specialty, phone) VALUES
30 ('Dr. Smith', 'Cardiology', '123-456-7890'),
31 ('Dr. Johnson', 'Neurology', '234-567-8901'),
32 ('Dr. Williams', 'Pediatrics', '345-678-9012');
33 -- Insert sample data into Patients
34 INSERT INTO Patients (name, age) VALUES
35 ('Alice', 30),
36 ('Bob', 45),
37 ('Charlie', 10);
38 -- Insert sample data into Appointments
39 INSERT INTO Appointments (doctor_id, patient_id, appointment_date) VALUES
40 (1, 1, '2024-07-01'),
41 (2, 2, '2024-07-02'),
42 (3, 3, '2024-07-03');
43 -- Query to find all appointments with doctor and patient names
44 SELECT a.appointment_date, d.name AS doctor_name, p.name AS patient_name
45 FROM Appointments a
46 JOIN Doctors d ON a.doctor_id = d.doctor_id
47 JOIN Patients p ON a.patient_id = p.patient_id;
48 -- Query to find the number of appointments for each doctor
49 SELECT d.name AS doctor_name, COUNT(a.appointment_id) AS appointment_count
50 FROM Doctors d
51 LEFT JOIN Appointments a ON d.doctor_id = a.doctor_id
52 GROUP BY d.doctor_id;
53 -- Query to find patients with appointments in the next 7 days
```

```
53 -- Query to find patients with appointments in the next 7 days
54 SELECT p.name AS patient_name, a.appointment_date
55 FROM Patients p
56 JOIN Appointments a ON p.patient_id = a.patient_id
57 WHERE a.appointment_date BETWEEN CURDATE() AND DATE_ADD(CURDATE(), INTERVAL 7 DAY);
58 -- Query to find doctors with no appointments
59 SELECT d.name AS doctor_name
60 FROM Doctors d
61 LEFT JOIN Appointments a ON d.doctor_id = a.doctor_id
62 WHERE a.appointment_id IS NULL;
63 -- Query to find the average age of patients for each doctor
64 SELECT d.name AS doctor_name, AVG(p.age) AS average_age
65 FROM Doctors d
66 JOIN Appointments a ON d.doctor_id = a.doctor_id
67 JOIN Patients p ON a.patient_id = p.patient_id
68 GROUP BY d.doctor_id;
69
```

Output

Tables in ai_lab16

Filter...

appointments
doctors
patients

doctor_id	name	specialty	phone
Filter...	Filter...	Filter...	Filter...
1	Dr. Smith	Cardiology	123-456-7890
2	Dr. Johnson	Neurology	234-567-8901

abc Filter...	abc Filter...	abc Filter...	abc Filter...	
1	Alice	2024-07-01	Dr. Smith	

Count total patients treated by each doctor

doctor_name	total_patients	
abc Filter...	abc Filter...	
Dr. Smith	1	
Dr. Johnson	1	
Dr. Williams	1	

Explanation

In this assignment, I designed a database of Hospital Management System in SQL. Then I developed a database and called it, ai_lab16. I developed three tables, Doctors, Patients, and Appointments using prompt . The arrangements are represented in the tables in which the information is stored concerning the doctors, patients, and their appointments, and relationships are anchored with the help of the foreign keys. Once the tables were made, I entered sample data in the tables. Subsequently, made queries to obtain patient history based on patient ID and also to get the number of patients treated by each doctor. Lastly, to test the query results and tables,used SELECT statements.

Task 2 – Real-Time Application: Online Shopping Database

Prompt

- Create schema and queries for an Online Shopping Database with tables
- Users, Products, Orders, and OrderDetails including relationships
- and analytical queries.

Code

```
Run on active connection | Select block
1  -- Create schema and queries for an Online Shopping Database with tables
2  -- Users, Products, Orders, and OrderDetails including relationships
3  -- and analytical queries.
4  -- Create the database
5  CREATE DATABASE IF NOT EXISTS ecommerce;
6  USE ecommerce;
7  -- Create Users table
8  CREATE TABLE Users (
9      user_id INT AUTO_INCREMENT PRIMARY KEY,
10     username VARCHAR(50) NOT NULL UNIQUE,
11     email VARCHAR(100) NOT NULL UNIQUE,
12     password VARCHAR(255) NOT NULL,
13     created_at TIMESTAMP DEFAULT CURRENT_TIMESTAMP
14 );
15 -- Create Products table
16 CREATE TABLE Products (
17     product_id INT AUTO_INCREMENT PRIMARY KEY,
18     name VARCHAR(100) NOT NULL,
19     description TEXT,
20     price DECIMAL(10, 2) NOT NULL,
21     stock INT NOT NULL,
22     created_at TIMESTAMP DEFAULT CURRENT_TIMESTAMP
23 );
24 -- Create Orders table
25 CREATE TABLE Orders (
26     order_id INT AUTO_INCREMENT PRIMARY KEY,
32 -- Create OrderDetails table
33 CREATE TABLE OrderDetails (
34     order_detail_id INT AUTO_INCREMENT PRIMARY KEY,
35     order_id INT NOT NULL,
36     product_id INT NOT NULL,
37     quantity INT NOT NULL,
38     price DECIMAL(10, 2) NOT NULL,
39     FOREIGN KEY (order_id) REFERENCES Orders(order_id),
40     FOREIGN KEY (product_id) REFERENCES Products(product_id)
41 );
42 -- Queries
43 -- 1. Retrieve all orders by a user
44 SELECT * FROM Orders WHERE user_id = 1;
45 -- 2. Find the most purchased product.
46 SELECT p.name AS product_name, SUM(od.quantity) AS total_quantity_sold
47 FROM OrderDetails od
48 JOIN Products p ON od.product_id = p.product_id
49 GROUP BY od.product_id
50 ORDER BY total_quantity_sold DESC
51 LIMIT 1;
52
53 --3. Calculate total revenue in a given month.
54 SELECT SUM(total_amount) AS total_revenue
55 FROM Orders
56 WHERE YEAR(order_date) = 2023 AND MONTH(order_date) = 10;
```

Output

Retrieve all orders by a user.

order_id	user_id	order_date	total_amount	
abc Filter...	abc Filter...	abc Filter...	abc Filter...	
1	1	2026-03-19 00:08:35	50000.00	

Find the most purchased product.

product_name	total_quantity_s...	
abc Filter...	abc Filter...	
Laptop	1	

Calculate total revenue in a given month.

total_revenue	
abc Filter...	
NULL	

Explanation

In the E-commerce platform. I have firstly created a database named ecommerce and designed four tables namely: Users, Products, Orders and OrderDetails. The following tables are used to store customer and product information and purchase orders. The associations between tables were ensured with the help of foreign keys. Once the tables have been created, added the sample data to recreate an online shopping System. then carried out analytical observations to find orders made by a user, the most sold product, and total revenue realized in a given month. Lastly, checked the results with the help of SELECT queries..

Task 3 – Library Database

Prompt

- Create schema and queries for a Library Management System with tables
- Books, Members, and Loans including relationships and indexing for faster queries.

Code

```
ai 16.3 > library.sql > ...  
  ▸ Run on active connection | ≡ Select block  
1  -- Create schema and queries for a Library Management System with  
2  -- Books, Members, and Loans including relationships and indexes  
3  
4  CREATE DATABASE IF NOT EXISTS LibraryDB;  
5  USE LibraryDB;  
6  
7  -- Create Books table  
8  CREATE TABLE IF NOT EXISTS Books (  
9      book_id INT AUTO_INCREMENT PRIMARY KEY,  
10     title VARCHAR(255) NOT NULL,  
11     author VARCHAR(255) NOT NULL,  
12     published_year INT,  
13     genre VARCHAR(100)  
14 );  
15  
16 -- Create Members table  
17 CREATE TABLE IF NOT EXISTS Members (  
18     member_id INT AUTO_INCREMENT PRIMARY KEY,  
19     name VARCHAR(255) NOT NULL,  
20     email VARCHAR(255) UNIQUE NOT NULL,  
21     join_date DATE  
22 );  
23  
24 -- Create Loans table  
25 CREATE TABLE IF NOT EXISTS Loans (  
26     loan_id INT AUTO_INCREMENT PRIMARY KEY,
```

```

27     book_id INT,
28     member_id INT,
29     loan_date DATE,
30     return_date DATE,
31     FOREIGN KEY (book_id) REFERENCES Books(book_id),
32     FOREIGN KEY (member_id) REFERENCES Members(member_id)
33 );
34
35 -- Sample data insertion
36 INSERT INTO Books (title, author, published_year, genre) VALUES
37 ('Database Systems', 'Navathe', 2016, 'Education'),
38 ('Operating Systems', 'Silberschatz', 2018, 'Education'),
39 ('Computer Networks', 'Tanenbaum', 2017, 'Education');
40
41 INSERT INTO Members (name, email, join_date) VALUES
42 ('Alice', 'alice@gmail.com', '2024-01-01'),
43 ('Bob', 'bob@gmail.com', '2024-02-01');
44
45 INSERT INTO Loans (book_id, member_id, loan_date, return_date) VALUES
46 (1, 1, '2024-06-01', NULL),
47 (2, 2, '2024-05-01', NULL);
48

```

```

▷Run on active connection | ≡ Select block
1 -- Retrieve all books currently issued
2 SELECT b.title, m.name, l.loan_date
3 FROM Loans l
4 JOIN Books b ON l.book_id = b.book_id
5 JOIN Members m ON l.member_id = m.member_id
6 WHERE l.return_date IS NULL;
7
8 -- Find overdue books (loan date > 30 days)
9 SELECT b.title, m.name, l.loan_date
10 FROM Loans l
11 JOIN Books b ON l.book_id = b.book_id
12 JOIN Members m ON l.member_id = m.member_id
13 WHERE l.loan_date < DATE_SUB(CURDATE(), INTERVAL 30 DAY);
14
15 -- Count number of books loaned by each member
16 SELECT m.name, COUNT(l.book_id) AS total_books
17 FROM Members m
18 LEFT JOIN Loans l ON m.member_id = l.member_id
19 GROUP BY m.member_id;

```

Output

Retrieve all books currently issued.

title	name	loan_date	
abc Filter...	abc Filter...	abc Filter...	
Database Systems	Alice	2024-06-01	
Operating Systems	Bob	2024-05-01	

Find overdue books (loan date > 30 days).

-- Retrieve all books currently issued SELE...		-- Find overdue books (loan date > 30 da...	
title	name	loan_date	
abc Filter...	abc Filter...	abc Filter...	
Database Systems	Alice	2024-06-01	
Operating Systems	Bob	2024-05-01	

Count number of books loaned by each member.

< -- Find overdue books (loan date > 30 da...		-- Count number of books loaned by each...	
name	total_books		
abc Filter...	abc Filter...		
Alice	1		
Bob	1		

Explanation

In this task, I created a database of Library Management System using SQL. Initially I have established a database called LibraryDB and have created three tables: Books, Members and Loans. The library has these tables that hold the information on books in the library, registered members and books borrowed by members. The tables are linked through foreign keys to ensure that there are relationships. The Loans table was also indexed on to enhance the performance of queries. I ran queries after feeding the sample data and I was able to retrieve currently issued books, locate overdue books that had been borrowed over 30 days and chosen on how many books the member had borrowed. I lastly confirmed the queries with SELECT statements.

Task 4: Optimize Queries

Prompt

-- Analyze and optimize SQL queries using joins and indexing to improve performance.

Code

```
SELECT *
FROM Books
WHERE author_id IN (
    SELECT author_id
    FROM Authors
    WHERE country = 'UK'
);
```

```
-- Analyze an SQL query and optimize it for better performance.
-- Use joins instead of subqueries and suggest indexes if needed.
-- Ensure both original and optimized queries return the same result.
SELECT b.title, a.name
FROM Books b
JOIN Authors a ON b.author_id = a.author_id
WHERE a.country = 'UK';
```

Output

book_id	title	author	published_year
a Filter...	a Filter...	a Filter...	a Filter...
1	Database Systems	Navathe	2016

book_id	title	author	published_year	genre	author_id
a Filter...	a Filter...	a Filter...	a Filter...	a Filter...	a Filter...
1	Database Systems	Navathe	2016	Education	1

Explanation

This task involved processing and optimization of an SQL query with AI-based methodology. I have first analyzed the initial query that made a subquery to search books authored by the UK authors. Subqueries may also be slow in large data sets. I then optimized the query using the subquery with a JOIN operation that would give better performance and efficiency. I also proposed the addition of indexes on some important columns to fasten the search of data. Lastly, I ran both queries and made sure that it gave the same output and the optimized query works with bigger data sets.

Task 5: University Course Registration

Prompt

- Create schema and queries for a University Course Registration system
- with tables Students, Courses, Faculty, and Registrations including
- relationships and analytical queries.

Code

```
1  -- Create schema and queries for a University Course Registration system
2  -- with tables Students, Courses, Faculty, and Registrations including
3  -- relationships and analytical queries.
4  CREATE DATABASE IF NOT EXISTS University;
5  USE University;
6  CREATE TABLE Students (
7      student_id INT AUTO_INCREMENT PRIMARY KEY,
8      name VARCHAR(100),
9      major VARCHAR(50)
10 );
11 CREATE TABLE Courses (
12     course_id INT AUTO_INCREMENT PRIMARY KEY,
13     course_name VARCHAR(100),
14     credits INT
15 );
16 CREATE TABLE Faculty (
17     faculty_id INT AUTO_INCREMENT PRIMARY KEY,
18     name VARCHAR(100),
19     department VARCHAR(50)
20 );
21 CREATE TABLE Registrations (
22     registration_id INT AUTO_INCREMENT PRIMARY KEY,
23     student_id INT,
24     course_id INT,
25     faculty_id INT,
26     semester VARCHAR(20),
27     FOREIGN KEY (student_id) REFERENCES Students(student_id),
28     FOREIGN KEY (course_id) REFERENCES Courses(course_id),
29     FOREIGN KEY (faculty_id) REFERENCES Faculty(faculty_id)
30 );
31 INSERT INTO Students (name, major) VALUES
32 ('Alice Johnson', 'Computer Science'),
33 ('Bob Smith', 'Mathematics');
```

```

33 ('Bob Smith', 'Mathematics');
34 INSERT INTO Courses (course_name, credits) VALUES
35 ('Data Structures', 4),
36 ('Calculus', 3);
37 INSERT INTO Faculty (name, department) VALUES
38 ('Dr. Emily Davis', 'Computer Science'),
39 ('Dr. Michael Brown', 'Mathematics');
40 INSERT INTO Registrations (student_id, course_id, faculty_id, semester) VALUES
41 (1, 1, 1, 'Fall 2024'),
42 (2, 2, 2, 'Fall 2024');
43
44 --QUERIES
45 -- 1. List all students enrolled in a specific course
46 SELECT s.name AS student_name, c.course_name
47 FROM Students s
48 JOIN Registrations r ON s.student_id = r.student_id
49 JOIN Courses c ON r.course_id = c.course_id
50 WHERE c.course_name = 'Data Structures';
51 -- 2. Find faculty members teaching more than 2 courses.
52 SELECT f.name AS faculty_name, COUNT(r.course_id) AS course_count
53 FROM Faculty f
54 JOIN Registrations r ON f.faculty_id = r.faculty_id
55 GROUP BY f.faculty_id
56 HAVING COUNT(r.course_id) > 2;
57 -- 3. Retrieve courses with the highest number of registrations.
58 SELECT c.course_name, COUNT(r.student_id) AS student_count
59 FROM Courses c
60 JOIN Registrations r ON c.course_id = r.course_id
61 GROUP BY c.course_id
62 ORDER BY student_count DESC
63 LIMIT 1;

```

Output

List all students enrolled in a specific course.

/*-- Create schema and queries for a Univ...		USE University;	CREATE TABLE
student_name	course_name		
abc Filter...	abc Filter...		
Alice Johnson	Data Structures		
Alice Johnson	Data Structures		
Alice Johnson	Data Structures		
Alice Johnson	Data Structures		

Find faculty members teaching more than 2 courses.

/*-- Create schema and queries for a Univ...		USE University;	CREATE TABLE
faculty_name	course_count		
abc Filter...	abc Filter...		
Dr. Emily Davis	4		
Dr. Michael Brown	4		

Retrieve courses with the highest number of registrations.

/*-- Create schema and queries for a Univ...		
course_name	student_count	
abc Filter...	abc Filter...	
Data Structures	4	

Explanation

In this task, I created a University Course Registration database. I used a table to manage the enrollment of students, faculties, courses and registrations. The faculty is designated to each course, and students are allowed to take several courses. Foreign keys are also used to establish relationships between the tables. I used queries to list students who are enrolled in a particular course, those who teach more than 2 courses and retrieve courses with the greatest number of registrations after I was able to insert sample data.
